Executive Summary

1. **High-level takeaways**
    a. **Number of clients (689)** using the platform is consistent through this first half.
    b. **Distribution of clients per segment is also constant** through time.
    c. **Engagement Intensity** was defined as KPI as the number of events per client (number of events divided by number of clients). This will help us measure the average efficiency by segment and tenure.
    d. The top **5 types of clients** who engage more with us are **Finance Insurance, Legal Consulting Gov, Large Providers, Mid Providers and Large Operator.**
    e. The top **5 types of events** are **List Downloaded, Email, Content Detail, Content List and General Search**; being the first one the main indicator of high engagement intensity.
    f. An event of downloading type (list_downloaded) must be the most important for us. **Downloading from our platform directly translate into a client taking action or decisions based on the data we provide.** It means a client find our service useful and will stay with us (we avoid churn).
    g. **Engagement intensity peaked at April (2.3K),** led by Finance Insurance clients, followed by Legal Consulting Gov.
    h. There were **two anomalies** on **April** (increased engagement by only two segments) and **May** (lowest negative variation overall).
2. **Taks**
    a. **Segment Comparison (Large Providers vs Large Operators)**
        i. Considering both old clients and first year ones, **large providers have a higher engagement intensity.**
        ii. **Providers have 1.6K in average vs 0.8K from operators.** It is also important to say that the **operators have a higher interaction through email and content detail**, which is a **great opportunity to increase the engagement** and retention numbers.
        iii. As I stated in the overall key findings, the downloading event is the main indicator of higher engagement. That is what is happening here. Even though, **operators check the emails and content detail more (55.9%), they don’t download as much as providers (67% vs 37.7%)**, which it is the last step of the funnel for BNAmericas.
        iv. This should be a **churn alert** for us. If operators keep “just looking”, eventually **they will cancel the subscription since they are not finding value enough to download.**

   v. We should look deeper in the onboarding process with **more targeted approach.**

b. **First-Year vs Non-First-Year Accounts**

   i. In the first half of 2024 **first year clients were the minority, with an average of 19 number of clients vs 671 from non-first year ones.**
   ii. Providers (large and mid) are the majority for both.
   iii. Engagement wise, **first year clients are led by Providers**, while non first year ones by Finance Insurance and Legal consulting Gov.
   iv. While **non-first year clients have a stablished event distribution led by downloading (68.8%)** with more consistent accounts, as expected, it is not the case for the first-year ones. **First-year downloading behavior is inconsistent.**
   v. Since **first-year** ones are a minority, one client can download information from the platform and the next month not, causing the distribution fluctuate a lot (client 91fb3157e1 on February). **This caused both, the peak in February and the fall of engagement intensity in March.** I wouldn't be surprised if we see a fall again in July.
   vi. In addition, first-year's **engagement intensity has started closing the gap with non-first year** (1.1K vs 1.4K as of June 2024). However, this was led by an **increment in email and content detail events (38%)** while maintaining the inconsistent downloading behavior.
   vii. Again, **this raises a churn alert**, because first, **they are mostly interacting with the platform because of emails** and most of them just end up just "looking" at detail. **They don't get to the last step of the funnel.** This will make them realize they don't really need the service and cancel their subscription.
   viii. **The onboarding process should be improved** to avoid the previous point. Maybe accompany the client during the first months could be a good strategy for avoid churn and strengthen retention and also customer satisfaction.
   ix. Additionally, unlike non-first-year clients, **they tend to check the project forecast section considerably** (in the top 5 during this first half of 2024).

c. **Strategic Recommendation**

Base on what I stated so far, these are my key recommendations:

1. Since our main revenue comes from our clients' subscriptions, we must increase from the start the share of downloading events for the first-year clients to **avoid a high risk of early churn.** They check the email more, so **a targeted email campaign would be great.**
2. For the non-first-year clients; we know their main engagement is by downloading, which is great, but can we do better? **We should increase the number of clients/accounts that download information every month.** By increasing our current 24% of clients to 30%, we can elevate engagement intensity from 1.75K to 2.2K, **significantly mitigating the risk of late-stage churn.**
3. I would encourage to work closely with the clients from **Finance Insurance** and **Mid Operator** segments in a **targeted retention strategy**. They are slowly showing signs of possible churn. This is why:
    a. **The Finance Insurance segment is aggressively reducing its engagement intensity** (-2K avg in the las 2 months) by reducing its downloading events, while the email share starts increasing.
    b. **The Mid Operator segment went from 54% in March to barely 2% in June on downloading event share.** High probability of churn here. They are just "looking".
4. Finally, **working on segmenting the not segmented clients is a must.** They have an incredible high engagement intensity. Maybe, this can help balance the rest of the segments for the better.

d. **Limitations & Nex Steps**

   i. Limitations of the dataset:

      1. The dataset was not cleansed or structured to be ready to use. (not optimal values for some columns)
      2. Low granularity
      3. Some clients are not segmented
      4. No documentation for the events.

   ii. Additional data I would like to have:

      1. Onboarding date would be great for identifying and analyzing cohorts to improve the onboarding process
      2. Data from previous years would be great to see the seasonal behavior to really know if what happened in April or May should be expected.
      3. Monthly finance results data from clients to see if there is some correlation of getting more engaged with the platform when business is improving or worsening
      4. Costs per segment to calculate ROI.
      5. More granularity of the date, to see if there are some behaviors per week maybe.
