

H1 Product Review

2024

The Roadmap

01

High-level takeaways

How is our engagement doing in the first half of the year?

02

Segment Comparison

Large Providers vs Large Operators

03

First-Year vs Non-First-Year

How much different are they from each other?

04

Strategic Recommendations

How do we improve adoption and retention?

01

High-level takeaways

Engagement Intensity was defined as KPI as the number of events per client.

High-level takeaways

- **Number of clients (689)** using the platform is consistent through this first half.
- **Engagement intensity peaked at April (2.3K)**, led by Finance Insurance clients.
- There were **two anomalies** on April (increased engagement by only two segments) and May (lowest negative variation overall).
- The **top 5 types of clients** who engage more with us are Finance Insurance, Legal Consulting Gov, Large Providers, Mid Providers and Large Operator.
- The top 5 types of events are **List Downloading**, Email, Content Detail, Content List and General Search; being the first one the **main indicator of high engagement intensity**.

02

Segment Comparison

Large providers have a higher engagement intensity than Large Operator

Segment Comparison

- By engagement intensity, providers have 1.6K in average vs 0.8K from operators.
- **Operators** have a higher interaction through **email and content detail**, which is a great opportunity to **increase the engagement and retention numbers**.
- While operators **check the emails more** (43% vs 18%), **they don't download as much as providers** (67% vs 37.7%).
- This should be a **churn alert** for us. If **operators** keep “just looking”, eventually **they will cancel the subscription since they are not finding value enough to download information**.

03

First-Year vs Non-First Year

19 vs 671 numbers of clients in average

First-Year vs Non-First Year

- While **non-first-year clients have a stablshed event distribution led by downloading (68.8%)*** with more consistent accounts, as expected, it is not the case for the others. **First-year's downloading behavior is inconsistent.**
- And since first-year ones are a minority, one client can download information from the platform and the next month not, causing the event distribution fluctuate a lot. **This caused both, the peak in February and the fall of engagement intensity in March.**
- First-year's engagement intensity has started closing the gap with non-first year (1.1K vs 1.4K as of June 2024).** However, **this was led by an increment in email and content detail events (38%) while maintaining the inconsistent downloading behavior.**
- First-year clients don't get to the last step of the funnel. **High risk of early churn for them.**

Inconsistency in downloading events for first-year

First-year's engagement has grown fast, but not for the event we want

04

Strategic Recommendations

Email should be the way

Strategic Recommendations

- For first-year clients, we must increase from the start the share of downloading events for the first-year clients to avoid a high risk of early churn. **They check the email more, so a targeted email campaign would be great.**
- For non-first-year clients, we should **increase the number of clients/accounts that download information every month.** By increasing our current 24% of clients to 30%, we can elevate engagement intensity from 1.75K to 2.2K, **significantly mitigating the risk of late-stage churn.**
- I would encourage to work closely with the clients from **Finance Insurance and Mid Operator** segments in a targeted **retention** strategy. **They are slowly showing signs of possible late state churn.**
- Finally, working on segmenting the **not segmented clients** is a must. **They have an incredible high engagement intensity.** Maybe, this can help balance the rest of the segments for the better.

The Finance Insurance segment is aggressively reducing its engagement intensity

The Mid Operator segment went from 59% in February to barely 2% in June on downloading event share.
